#### LOUISIANA PUBLIC SERVICE COMMISSION

#### **GENERAL ORDER**

Louisiana Public Service Commission, ex parte. Docket No. U-22252 (Subdocket-C) In re: BellSouth Telecommunications, Inc. Service Quality Performance Measurements.

(Decided at the August 19, 1998 Open Session)

On April 30, 1998, BellSouth Telecommunications, Inc. (BST or BellSouth) filed two revisions to its Statement of Generally Available Terms and Conditions (SGAT), including a proposal for Service Quality Performance Measurements (SQPM). At the June 17, 1998 Business and Executive Session, the Louisiana Public Service Commission (LPSC or Commission) adopted on an interim basis the SQPM filed by BellSouth. The Commission further ordered that a rule making proceeding be commenced and completed to determine final SQPM for presentation at the August 19, 1998 Business and Executive Session.

Louisiana Public Service Commission Staff (Staff) immediately published the opening of the above referenced docket and a request for comments in the next LPSC Bulletin dated June 26, 1998 following the June Business and Executive Session. Staff received comments on July 10, 1998 from e.spire, BST, MCI, Cox and AT&T and Direct Testimony of Melissa L. Closz from Sprint and Venetta Bridges from MCI. Reply comments were received on July 20, 1998 from AT&T, e.spire, Sprint and BST and Reply Testimony of Venetta Bridges with MCI. A technical conference was held on July 23, 1998. Staff requested additional comments on July 28, 1998 from any party with additional information on statistics, penalties and levels of disaggregation. Staff received additional comments from BST, MCI, AT&T and Intermedia Communications. Pursuant to the procedural schedule in the above referenced docket, BST, MCI, AT&T, Sprint, e.spire, and Cox filed reply comments to Staff's initial recommendation on August 10, 1998.

After examining the Parties' comments, reply comments, post-technical conference comments, reply comments to Staff's initial recommendation, and holding a technical conference, Staff issued the attached final recommendation concerning the BST SOPM.

Staff found that the Telecommunications Act of 1996 (the Act) requires that incumbent local exchange carriers (ILEC) provide services and facilities in a nondiscriminatory manner and on a just and reasonable basis.<sup>3</sup> Staff further found that these provisions of the Act are designed to hasten the development of competition in local exchange markets by ensuring incumbent carriers do not provide services and facilities in a manner that favor their own retail operations over competing carriers, or in a manner which favors certain competing carriers over others.<sup>4</sup> More simply, an ILEC must provide services and facilities to competitive local exchange carriers (CLECs) that are at least equal in quality to that provided by the ILEC to itself or to any affiliate, subsidiary, or any other party to which the ILEC provides service.<sup>5</sup> Finally, Staff found that adequate performance measurements and standards for UNEs and resold services are essential to the immediate development of local competition in the State of Louisiana.

<sup>! &</sup>lt;u>ld.</u>

<sup>47</sup> U.S.C. 251(c)(3) and (4).

In the Matter of Application by BellSouth Corporation, et al., Pursuant to Section 271 of the Communications Act of 1034, as amended, To Provide In-Region, InterLATA Services in Louisiana, CC Docket No. 97-231 (Rel. Feb. 4, 1998) para. 20,23,33.

Staff's final recommendation includes recommendations on performance measurements, levels of disaggregation, including product disaggregation and geographic disaggregation, standards and benchmarks, statistical tests, reporting, auditing and data detail, enforcement, dispute resolution and a procedural schedule.

Staff's recommendation (attached as Exh. bit A) is summarized in 12 points as follows: Staff recommended that the Commission (1) adopt the performance measurements attached as exhibit A to this recommendation. The measurements found in Exhibit A are those measurements submitted in BellSouth's proposal which have been modified as indicated in Exhibit A; (2) order the following levels of product disaggregation for provisioning, maintenance and repair performance measurement categories: resale<sup>6</sup> residential POTS, resale business POTS, resale ISDN, resale Centrex, resale PBX, other resale, unbundled loops 2-wire - w/interim number portability and - w/o interim number portability, unbundled loops all other - w/interim number portability and - w/o interim number portability, unbundled ports, interconnection trunks; (3) order BellSouth to report its performance measurements at the regional, state, and MSA MSA level reporting is only required where work is actually performed at that level. MSA level of reporting would also apply only to the following categories of performance measurements: provisioning, repair and maintenance, and trunk groups; (4) establish performance benchmarks only where no analogous retail service exist by ordering BellSouth to conduct special studies to establish the benchmark performance level. Such studies should rely on experiences drawn from BST's operations and be completed by November 30, 1998; (5) that a standard cutover time of five minutes, not to exceed fifteen minutes, be set as the standard for BellSouth to perform a loop cutover, including number portability; (6) order BellSouth to perform the statistical testing that it proposes (statistical process control), the modified z-test endorsed by the CLECs, and the pooled variance test offered by the FCC in its Notice of Proposed Rulemaking, Appendix B<sup>a</sup> so the competence of each test can be demonstrated over a reasonable period of time; (7)that BellSouth perform its proposed statistical test, the modified z-test endorsed by LCUG, and the FCC's proposed pooled variance test for those performance measurements where a retail analog exists, and where there is not an average computed, (8) that BellSouth collect the data necessary to run all three statistical tests for the following performance measurements which compute an average: Average OSS Response Interval-PreOrder and Ordering, Average Completion Interval-Provisioning, and Maintenance Average Duration.; (9) that reports on performance measurements be provided monthly to the Commission and each requesting CLEC indicating BellSouth's own internal performance, its performance for any BellSouth affiliate, its performance for all CLECs in aggregate, and its performance for the individual CLEC requesting the report and that BellSouth be required to maintain all data and information used in the compilation of the performance measurements and develop any necessary tracking systems; (10) that if a CLEC detects potential discrepancies between the CLEC's internally generated data and the data relied upon by BellSouth in the reporting process, the affected CLEC should be permitted to audit the data collection, computation and reporting processes of BellSouth within fifteen days of a written request, that those costs will be borne by the CLEC, that an annual comprehensive audit of BellSouth's performance performance measurements for both BellSouth and CLECs will occur for each of the next five years, that the audit be conducted by an independent third party, the results of the audit be made available to all parties, that the cost be borne 50% by BellSouth and 50% by the CLECs, that the selection of the independent third party audit be done with input from both BellSouth and the CLECs, that the scope of the audit be jointly determined by BellSouth and the CLECs, that the audit be done on a company-wide basis because small start-up

6

All resale measurements should also report for dispatched and non-dispatched service.

Staff recommends that the commission set benchmarks. However, reasonable benchmarks cannot be set unless BST conducts a special study of its internal operations.

The addition of the FCC's pooled variance test was done at the suggestion of BellSouth's expert, Bill Stacy, in a telephone conference between Staff and BellSouth on August 10<sup>th</sup>.

It appears to Staff that any undue burden placed on BellSouth only relates to measurements where an average is computed. Consequently, running a z-test and pooled variance test on these other measurements does appear to be a burdensome request.

CLECs may not have the resources to conduct audits, monitor performance, and detect discrimination; (11) adopt he recommended procedure for dispute resolution as follows: When a performance dispute arises, the aggrieved party must send written notice of the problem with a request for resolution to BellSouth. Service of the notice and request for resolution commences a fifteen day time period within which resolution of the problem shou. Accur. Bell outh and the CLEC must assemble a Joint Investigative Team comprised of subject nuster experts. The team must be co-chaired by a representative of BellSouth and the CLEC. A root-cause analysis must be conducted to determine the source of the problem. From this analysis a plan should be developed to remedy the problem. If the dispute cannot be resolved within 15 days, then either party may file a formal complaint with the Commission through the Division of Administrative Hearings. The ALJ assigned to the complaint should rule within 15 days of its filing. If either party disagrees with the ALJ ruling, the party may then appeal to the Commission; (12) that a detailed telephone Status Conference be held on September 15, 1998 to address scheduling of workshops, timing of studies that need to be undertaken, and further details of the issues that need to be addressed. Also, Staff recommends that a workshop schedule be established as follows: October - address issues of disaggregation and clarification of performance measurements; November - address statistical testing; December - address retail analogs; January - address enforcement and dispute resolution; February - address any remaining issues not resolved or completed in earlier workshops; and March - Staff will issue its Recommendation on issues agreed to by the Parties and any issues that require resolution by the Commission.

This matter was considered at the Commission's Open Session held on August 19, 1998. On motion of Commissioner Owen and seconded by Commissioner Dixon, and adopted by a unanimous vote, the Commission voted to accept the staff recommendation.

#### IT IS THEREFORE ORDERED THAT:

Staff's recommendation as set forth in Exhibit A, attached, is hereby adopted.

PRE-ORDERING AND ORDERING OSS

| ويباد المستور المستواع المستواع       | G AND ORDERING USS   |
|---------------------------------------|--|
| Function:                             | Average Response Interval for Pre-Ordering and Ordering & OSS Interface Availability   |
| Measurement<br>Overview:              | As an initial step of establishing service, the customer service agent must establish such basic facts as avail 'vility of desired features, likely service delivery intervals, the telephone number to be assigned, product and feature availability, and the validity of the street address. Typically, this type of information is gathered from the supporting OSS's while the customer (or potential customer) is on the telephone with the customer service agent. This information may be gathered via stand-alone pre-order inquiries or as part of the ordering function. Pre-ordering/ordering activities are the first contact that a customer may have with a CLEC. This measure is designed to monitor the time required for the CLEC interface systems to obtain from legacy systems the pre-ordering/ordering information necessary to establish and modify service. This measurement also captures the availability percentages for the BST systems that the CLEC uses during pre-ordering and ordering. Comparison to BST results allow conclusions as to whether an equal opportunity exists for the CLEC to deliver a comparable customer experience. |
| Measurement Methodology:              | 1. Average OSS Response Interval = Sum [(Date & Time of Legacy Response) - (Date & Time of Legacy Request)]/(Number of Legacy Requests During the Reporting Period)  The response interval for retrieving pre-order/order information from a given legacy is determined by summing the response times for all requests (contracts) submitted to the  |
| 10                                    | legacy during the reporting period and then dividing by the total number of legacy requests for the reporting period. For that day. The response interval starts when the client application (LENS for CLECs; RNS for BST) submits a request to the legacy system and ends when the appropriate response is returned to the client application. The number of legacy accesses during the reporting period that take less than 2.3 seconds and the number that take more than 6 seconds are also captured.  |
|                                       | Definition: Average response time for accessing legacy data associated with appointment scheduling, service & feature availability, address verification, request for Telephone Numbers (TNs), and Customer Service Records (CSRs).  |
| · · · · · · · · · · · · · · · · · · · | 2. OSS Interface Availability = (Actual Availability)/(Scheduled Availability) X 100   |
|                                       | Definition: Percent of time OSS interface is actually available compared to scheduled availability. Availability percentages for CLEC interface systems and for all legacy systems accessed by them are captured.  |
|                                       |  |

<sup>&</sup>lt;sup>1</sup> Change reflects a clarification. The metric is measured for the reporting period however, the discussion 1998 indicated the number of requests for a day.

#### <u>ORDERING</u>

| Function:    | Ordering   |
|--------------|--|
| Measurement  | When a customer calls their service provider, they expect to get information promptly    |
| Overview:    | regarding the progress on their order(s). Likewise, when changes must be made, such      |
|              | as to the expected delivery date, customers expect that 'ey will be immediately          |
| '            | notified so that they may modify their own plans. The onin status measurements           |
|              | monitor, when compared to applicable BST results, that the CLEC has timely access to     |
| 1            | order progress information so that the customer may be updated or notified when          |
| 4"           | changes and rescheduling are necessary.  |
| Measurement  | 1. Percent Flow-through Service Requests = Σ (Total Number of valid <sup>2</sup> Service |
| Methodology: | Requests that flow-through to the BST OSS) / (Total Number of valid Service Requests     |
|              | delivered to BST OSS) X 100.   |
|              | ,  |
|              | Definition: Percent Flow-through Service Requests measures the percentage of orders      |
| i            | submitted electronically that utilize BSTs' OSS without manual (human) intervention.     |
|              |  |
|              | Methodology:   |
|              | Mechanized tracking for flow-through service requests and manual SOER error              |
|              | audit reports (3/31/98). Mechanized tracking for SOER errors and flow-through            |
|              | (4/30/98).   |
|              | BST mechanized order tracking.   |
|              |  |
|              | 2. Percent Rejected Service Requests = Σ (Total Number of Rejected Service Requests)     |
|              | / (Total Number of Service Requests Received) X 100.                                     |
|              |  |
|              | Definition: Percent Rejected Service Requests is the percent of total orders received    |
|              | rejected due to error or omissions.  |
|              |  |
|              | Methodology:   |
|              | Manual tracking for non flow-through service requests                                    |
|              | Mechanized tracking for flow-through service requests                                    |
|              | BST retail report not applicable.  |
|              |  |
|              | 3. Reject Interval = E [ (Date and Time of Service Request Rejection) - (Date and Time   |
|              | of Service Request Receipt)]/(Number of Service Requests Rejected in Reporting           |
| 4            | Period). Requests are provided based on four (4) hour increments within a 24 hour        |
| ę.           | period, along with the percent greater than 24 hours.                                    |
|              |  |
|              | Definition: Reject Interval is the average reject time from receipt of service order     |
|              | request to distribution of rejection.  |
|              | Made data  |
|              | Methodology:   |
| 1            | Non-Mechanized Results are based on actual data from all orders.                         |
| j.           | Mechanized Results are based on actual data for all orders from the OSS.                 |
|              | BST retail report not applicable.  |

<sup>&</sup>lt;sup>2</sup> Change reflects a clarification. The metric did not include the word "valid" in the numerator, however, "valid" was included in the denominator. Likewise, Staff added "total" in the numerator to be consistent with the denominator.

General Order dated August 31, 1998

#### **ORDERING**

# Measurement Methodology:

4. Firm Order Confirmation Timeliness = Σ [ (Date and Time of Firm Order Confirmation) - (Date and Time of Service Request Receipt) ] / (Number of Service Requests Confirmed in Reporting Period)

Definition: <u>Interval for Return of a Firm Order Confirmation (FOC Interval)</u> is the average response time from receipt of valid service order request to distribution of order confirmation. Results are provided based on four (4) hour increments within a 24 hour period, along with the percent greater than 24 hours.

#### Methodology:

- Non-Mechanized Results are based on actual data from all orders.
- Mechanized Results are based on actual data for all orders from the OSS.
- BST retail report not applicable.
- 5. Speed of Answer in Ordering Center \* 2 (Total time in seconds to reach LCSC) / (Total # of Calls) in Reporting Period.

Definition: Measures the average time to reach a BST representative. This can be an important measure of adequacy in a manual environment or even in a mechanized environment where CLEC service representatives have a need to speak with their BST peers.

#### Methodology:

- Mechanized tracking through LCSC Automatic Call Distributor.
- Mechanized tracking through BST retail center support systems.

# **PROVISIONING**

| Function:    | Average Completion Interval and Order Completion Interval Distribution                    |
|--------------|---|
| Measurement  | The "average completion interval" measure monitors the time required by BST to            |
| Overview:    | deliver integrated and ope, ble service components equested by the CLEC, regardless       |
|              | of whether resale services or a bundled network elements are employed. When the           |
|              | service delivery interval of BST is measured for comparable services, then conclusions    |
|              | can be drawn regarding whether or not CLECs have a reasonable opportunity to              |
|              | compete for customers. The "order completion interval distribution" measure monitors      |
| N.           | the reliability of BST commitments with respect to committed due dates to assure that     |
|              | CLECs can reliably quote expected due dates to their retail customer. In addition,        |
|              | when monitored over time, the "average completion interval" and "percent completed        |
|              | on time" may prove useful in detecting developing capacity issues.                        |
| Measurement  | 1. Average Completion Interval = E [ (Completion Date & Time) - (Order Issue Date         |
| Methodology: | & Time) ] / (Count of Orders Completed in Reporting Period)                               |
|              |   |
|              | 2. Order Completion Interval Distribution = Σ (Service Orders Completed in "X"            |
| ٨.           | days) / (Total Service Orders Completed in Reporting Period) X 100                        |
|              |   |
|              | The actual completion interval is determined for each order processed during the          |
|              | reporting period. The completion interval is the elapsed time from BST receipt of a       |
|              | syntactically correct order from the CLEC to BST's actual order completion date.          |
|              | Elapsed time for each order is accumulated for each reporting dimension. The              |
|              | accumulated time for each reporting dimension is then divided by the associated total     |
|              | number of orders completed within the reporting period.                                   |
|              | The distribution of completed orders is determined by first counting, for each specified  |
|              | reporting dimension, the total numbers of orders completed within the reporting           |
|              | interval and the interval between the issue date of each order and the completion date.   |
|              | D&F orders where the CLEC serves as the agent for the end-user are included in this       |
|              | measurement. For each reporting dimension, the resulting count of orders completed        |
|              | for each specified time period following the issue date is divided by the total number of |
|              | orders completed with the resulting fraction expressed as a percentage.                   |
|              |   |
| •            |   |
|              | Definition: Average time from issue date of service order to actual order completion      |
|              | date.   |
|              |   |
|              | Methodology:  |
|              | Mechanized metric from ordering system  |

### \*PROVISIONING

| Function:    | Held Order Interval Distribution and Mean Interval  |
|--------------|---|
| Measurement  | When delays occur in completing CLEC orders, the average period that CLEC orders  |
| Overview:    | are held for BST reasons, pending a delayed completion, should be no worse for the  |
|              | CLEC when compared a BST delayed orders.  |
| Measurement  | 1. Mean Held Order Interval = Σ (Reporting Period Care Date - Committed Order   |
| Methodology: | Due Date) / (Number of Orders Pending and Past The Committed Due Date) for all  |
|              | orders pending and past the committed due date.   |
|              | This metric is computed at the close of each report period. The held order interval is established by first identifying all orders, at the close of the reporting interval, that both have not been reported as "completed" via a valid completion notice and have passed the currently "committed completion date" for the order. Held orders due to end-user reasons are included and identified in this report. For each such order the number of calendar days between the committed completion date and the close of the reporting period is established and represents the held order interval for that particular order. The held order interval is accumulated by the standard groupings, unless otherwise noted, and the reason for the order being held, if identified. The total number of days accumulated in a category is then divided by the number of held orders within the same category to produce the mean held order interval. |
|              | 2. Held Order Distribution Intervals  |
|              | (# of Orders Held for ≥ 90 days) / (Total # of Orders Pending But Not Completed) X 100.   |
|              | (# of Orders Held for ≥ 15 days) / (Total # of Orders Pending But Not Completed) X 100.   |
|              | This "percentage orders held" measure is complementary to the held order interval but is designed to reflect orders continuing in a "non-completed" state for an extended period of time. Computation of this metric utilizes a subset of the data accumulated for the "held order interval" measure. All orders, for which the "held order interval" equals or exceeds 90 or 15 days are counted, unless otherwise noted as an exclusion. The total number of pending and past due orders are counted (as was done for the held order interval) and divided into the count of orders held past 90 or 15 days.  |
|              | Definition: Average time orders continue in a "non-complete" state for an extended period of time.  |
|              | Methodology:  • Mechanized metric from ordering system.   |

General Order dated August 31, 1998

<sup>9</sup> Ibid.

| Function:                | Installation Timeliness, Quality & Accuracy   |
|--------------------------|---|
| Measurement<br>Overview: | The "percent missed installation appointments" measure monitors the reliability of BST commitments with respect to committed due dates to assure that CLECs can reliably quote expected due dates to their retail customer as compared to BST. Percent Provisioning Troubles within 30 days of Installation measures the quality and accuracy of installation activities.   |
| Measurement Methodology: | 1. Percent Missed Installation Appointments = \( \text{Number of Orders missed in Reporting Period} \) / (Number of Orders Completed in Reporting Period) X 100  Percent Missed Installation Appointments is the percentage of total orders processed for which BST is unable to complete the service orders on the committed due dates.   Missed Appointments caused by end-user reasons will be included and reported separately.  Definition: Percent of orders where completion's are not done by due date. See "Exclude Situations" for orders not included in this measurement  Methodology:  Mechanized metric from ordering system  2. % Provisioning Troubles within 30 days of Service Order Activity = \( \text{L} \) (Trouble reports on Services installed \( \leq \) 30 days following service order(s) completion) / (All Service Orders in a calendar month) X 100  Definition: Measures the quality and accuracy of completed orders  Methodology:  Mechanized metric from ordering and maintenance systems. |

| Function:                   | Coordinated Customer Conversions   |
|-----------------------------|--|
| Measurement<br>Overview:    | This category measures the average time it takes BST to disconnect an unbundled loop from the BST switch and cross connect it to a CLEC's equipment. This measurement enly applies to service orders with and without LNP, with and without INP <sup>13</sup> and where the CLEC has requested LST to provide a coordinated cut-over |
| Measurement<br>Methodology: | <ol> <li>Average Coordinated Customer Conversion Interval = [Σ [(Completion Date and Time for Cross Connection of an Unbundled Loop/with LNP<sup>14</sup>). Disconnection Date and Time of an Unbundled Loop/with LNP)]] / Total Number of Unbundled Loop Orders with/LNP for the reporting period.</li> </ol>                       |

Change reflects Staff's recommendation that UNEs be disaggregated between those with INP and without INP as well as with and without LNP. This is consistent with the FCC Notice of Proposed Rulemaking, where BellSouth has indicated that the level of product disaggregation is acceptable.

14 Ibid.

MSA was added to reflect Staff's recommendation that geographic disaggregation reflect Metropolitan
 Statistical Areas.
 General Order dated August 31, 1998

<sup>16</sup> Change reflects Staff's recommendation that UNEs be disaggregated between those with INP and without INP as well as with and without LNP. This is consistent with the PCCn Verip Of deep that Rulturghist 34) 4998 BellSouth has indicated that the level of product disaggregation is acceptable

#### **PROVISIONING**

| Function:                   | Average Completion Notice Interval   |
|-----------------------------|--|
| Measuremen.<br>Overview:    | The receipt of a completion notice by the CLEC from BST informs the carrier that their formal relationship with a customer has begun. This is useful to the CLEC in turn it lets them know that they can begin with activities such as billing the customer for service. |
| Measurement<br>Methodology: | <ol> <li>Average Completion Notice Interval = Σ[(Date &amp; Time of Notice of Completion)         - (Date &amp; Time of Work Completion)] / (Number of Orders Completed<sup>17</sup> in Reporting Period)</li> </ol>   |
|                             | Definition: The Completion Notice Interval is the elapsed time between the BST reported completion of work and the issuance of a valid completion notice to the CLEC. There is no equivalent BST Retail Measurement.   |

#### MAINTENANCE & REPAIR

| Function:                   | OSS Response Interval  |
|-----------------------------|--|
| Measurement<br>Overview:    | <ul> <li>This measure is designed to monitor the time required for the CLEC interface system to obtain from BST's legacy systems the information required to handle maintenance and r rair functions. This measure also addresses the availability of the OSS interface for it pair and maintenance.</li> </ul>  |
| Measurement<br>Methodology: | 1. OSS Interface Availability = (Actual Availability)/(Scheduled Availability) X 100   |
|                             | Definition: This measure shows the percentage of time the OSS interface is actually available compared to scheduled availability. Availability percentages for the CLEC and BST interface systems and for legacy systems accessed by them are captured.  |
|                             | Methodology: Mechanized reports from OSSs.   |
|                             | 2 OSS Response Interval = Access Times in Increments of Less Than or Equal to 4 Seconds, Greater Than 4 Seconds but Less Than or Equal to 10 Seconds, Less Than or Equal to 10 Seconds, Greater Than 10 Seconds, or Greater Than 30 Seconds.   |
|                             | Definition: Response intervals are determined by subtracting the time a request is submitted from the time the response is received. Percentages of requests falling into the categories listed above are reported, along with the actual number of requests falling into those categories. This measure provides a method to compare BST and CLEC response times for accessing the legacy data needed for maintenance & repair functions. |
|                             | Methodology: Mechanized reports from OSSs.   |

### MAINTENANCE AND REPAIR

| Function:                   | Average Answer Time pair Centers  |
|-----------------------------|---|
| Measurement Overview:       | • This measure s monitors 'hat BSTs handling of support center calls from CLLCs are comparable with support center calls by BST's retail customers.       |
| Measurement<br>Methodology: | 1. Average Answer Time for BST's Repair Centers = (Total time in seconds for BST's Repair Centers response) / (Total number of calls) by reporting period |
| <i>i</i> .                  | Definition: This measure demonstrates an average response time for the CLEC to contact a BST representative   |
|                             | Methodology: Mechanized report from Repair Centers Automatic Call Distributors.   |

### MAINTENANCE & REPAIR

| Function:                   | Missed Repair Appointments  |
|-----------------------------|---|
| Measurement<br>Overview:    | When the data for this measure is collected for BST and a CLEC it can be used to compare the percentage of accurate estimates of the time required to complete service repairs for BST and the CLEC.  |
| Measurement<br>Methodology: | 2. Percentage of Missed Repair Appointments = (Count of Customer Troubles Not Resolved by the Quoted Resolution Time and Date) / (Count of Customer Trouble Tickets Closed) X 100.  |
|                             | Definition: Percent of trouble reports not cleared by date and time committed. Note: Appointment intervals vary with force availability in the POTS environment. Specials and Trunk intervals are standard interval appointments of no greater than 24 hours. |
|                             | Methodology: Mechanized metric from maintenance database(s).  |

### MAINTENANCE & REPAIR

| Function:                   | Customer Trouble Report Rate  |
|-----------------------------|---|
| Measuremen. Overview:       | This measure can be r -d to establish the frequency (rate) of customer trouble reports and employed to compare 'LEC with BST results.   |
| Measurement<br>Methodology: | 1. Customer Trouble Report Rate = (Count of Initial and Repeated Trouble Reports in the Current Period) / (Number of Service Access Lines in Service at End of the Report Period) X 100. Note: Local Interconnection Trunks are reported only as total troubles.  |
|                             | The Customer Trouble Report Rate is computed by accumulating the number of maintenance initial and repeated trouble reports during the reporting period. The resulting number of trouble reports are divided by the total number of "service access lines" existing for CLECs and BST respectively at the end of the report period. |
| N.                          | Definition: Initial and repeated customer direct or referred troubles reported within a calendar month (Where cause is not in carrier equipment) per 100 lines/circuits in service.   |
|                             | Methodology: Mechanized metric for trouble reports and lines in service.  |

### MAINTENANCE & REPAIR

| Function:                   | Quality of Repair & Time to Restore  |
|-----------------------------|--|
| Measurement                 | This measure, when coll red for both the CLEC and BST and compared, monitors   |
| Overview:                   | that CLEC maintenance requests are cleared comparably to BST maintenance in quests.  |
| Measurement<br>Methodology: | 3. Maintenance Average Duration = (Total Duration Time from the Receipt to the Clearing of Trouble Reports ) / (Total Troubles)  |
| P                           | 4. Percent Repeat Troubles within 30 Days = (Total Repeated Trouble Reports within 30 Days) / (Total Troubles) X 100   |
|                             | 5. Out of Service (OOS) > 24 Hours = (Total Troubles OOS > 24 Hours) / (Total OOS Troubles) X 100  |
|                             | Definition: For Out of Service Troubles (no dial tone, cannot be called or cannot call out): the percentage of troubles cleared in excess of 24 hours.   |
|                             | For Percent Repeat Trouble Reports within 30 Days: Trouble reports on the same line/circuit as a previous trouble report within the last 30 calendar days as a percent of total troubles reported. |
|                             | For Average Duration: Average time from the receipt of a trouble until the trouble is cleared.   |
|                             | Methodology: Mechanized metric from maintenance database(s).   |

| Function:                   | Invoice Accuracy & Timeliness  |
|-----------------------------|--|
| Measurement<br>Overview:    | The accuracy of billing invoices delivered by BST to the CLEC must provide CLECs with the opportunity to deliver bills at least as accurate as those delivered by BST.  Producing and comparing this measurement result for both the CLEC and BST allows a determination as to whether or not parity exists.   |
| Measurement<br>Methodology: | 1. Invoice Accuracy = [(Total Local Services Billed Revenues during current month) - (/Total Adjustment Revenues during current month/) / Total Local Services Billed Revenues during current month] x 100  This measure provides the percentage accuracy of the billing invoices for a CLEC by dividing the difference between the total billed revenue and total adjustment revenues by the total billed revenues during the current month.  |
|                             | <ol> <li>Mean Time to Deliver Invoices = Σ[ (Invoice Transmission Date) - (Date of Scheduled Bill Cycle Close)]/(Count of Invoices Transmitted in Reporting Period) This measure provides the mean interval for billing invoices. CRIS-based invoices should be delivered within six (6) workdays, and CABS-based invoices should be delivered within eight (8) calendar days.</li> <li>Objective: Measures the percentage of accuracy and mean interval for timeliness of billing records delivered to CLECs in an agreed upon format.</li> </ol> |

### BILLING

| Function:    | Usage Data Delivery Accuracy, Timeliness & Completeness  |
|--------------|--|
| Measurement  | The accuracy of usage records delivered by BST to the CLEC must provide CLECs  |
| Overview:    | with the opportunity 'a deliver bills at least as accurate as those delivered by BST.  |
|              | Producing and comparing this measurement result for both the CLEC and BST allows   |
|              | a determination as to whether or not parity exists.  |
| Measurement  | 1. Usage Data Delivery Accuracy = (Total number of usage data packs sent during  |
| Methodology: | current month) - (Total number of usage data packs requiring retransmission  |
|              | during current month) / Total number of usage data packs sent during current month   |
|              | This measurement captures the percentage of recorded usage and recorded usage data   |
|              | packets transmitted error free and in an agreed upon format to the appropriate CLEC,   |
|              | as well as a parity measurement against BST Data Packet Transmission.  |
|              | 3. Usage Data Delivery Completeness = (Total number of Recorded usage records delivered during the current month that are within thirty (30) days of the message(usage record) create date) / (Total number of Recorded usage records  |
|              | delivered during the current month)  |
|              | This measurement provides percentage of recorded usage data (BellSouth recorded and usage recorded by other carriers) processed and transmitted to the CLEC within thirty (30) days of the message (usage record) create date. A parity measure is also provided showing completeness of BST messages processed and transmitted via CMDS.  |
| 3            | 3. Usage Data Delivery Timeliness = (Total number of usage records sent within six(6) calendar days from initial recording/receipt) / (Total number of usage records sent) <sup>27</sup> This measurement provides (BellSouth recorded and usage recorded by other carriers) delivered to the appropriate CLEC within six (6) calendar days from initial recording. A parity measure is also provided showing timeliness of BST messages processed and transmitted via CMDS. |
|              | Objective: The purpose of these measurements is to demonstrate the level of quality and timeliness of processing and transmission of both types of usage data (BellSouth recorded and usage recorded before other carriers) to the appropriate CLEC.   |
| ÷.           | Methodology: The usage data will be mechanically transmitted to the CLEC data processing center once daily. Timeliness and completeness measures are reported on the same report.  |

#### BILLING

| Reporting Dimensions: | Excluded Situations: |  |  |
|-----------------------|----------------------|--|--|
| CLEC Aggregate        | None                 |  |  |

The performance report provided by BellSouth shows the percentage of usage records sent within zero, one, two, three, four, five, six, seven, eight, nine, ten to 30, and over 30 days. Therefore, the concerns raised by the CLECs that BellSouth could be providing usage records in less than 6 days to itself and within 6 days for CLECs, but still be in parity, could be detected with the performance measurements reported by BellSouth.

REPORT: OPERATOR SERVICES TOLL AND DIRECTORY ASSISTANCE

REPORT PERIOD: XX/XX/19XX - XX/XX/19XX

STATE:

|                      | AVERAGE SPEED TO ANSWER (SECONDS) | % ANSWERED WITHIN "X" SECONDS |
|----------------------|-----------------------------------|-------------------------------|
| TOLL ASSISTANCE      | X                                 | % within 30 seconds           |
| DIRECTORY ASSISTANCE | X                                 | % within 20 seconds           |

| <u> 11711                                </u> |  |
|---|--|
| Function:                                     | Timeliness and Accuracy  |
| Business<br>Implications:                     | BellSouth's goal is to maintain 100% accuracy in the E911 database for all its     CLEC resale and retail customers by correctly processing all orders for E911     database updates. The 911 database update process ensures that the CLEC's     updates are handled in parity with BST's updates. BST uses Network Data Prover     (NDM) to transmit both CLEC resale and BST retail E911 updates to SCC (thus).   |
| 4   | party E911 database vendor) once per day for the entire region. No processing distinctions are made between CLEC records and BST records. These updates are processed within 24 hours.  • CLECs ordering unbundled switching and facility-based CLEC E911 providers are responsible for the accuracy of their data that is input into the E911 database. Facilities-based CLEC record updates are transmitted by the CLEC directly to  |
|   | <ul> <li>SCC without any BST involvement.</li> <li>When BST retail or resale records experience errors in SCC's system, the errors are not returned to BST for correction. Instead, SCC handles and corrects all errors within 24 hours for both CLEC resale records and BST retail records.</li> <li>BellSouth through its E911 third party vendor provides accuracy and timeliness measurements for BST and its CLEC resale customers. In addition, BellSouth through its E911 third party vendor provides an accuracy and timeliness report for CLECs ordering unbundled switching and facilities-based CLECs.</li> </ul> |
| Measurement                                   | 1. E911 Timeliness = Σ (Number of Confirmed Orders) - (Number of Orders missed in  |
| Methodology:                                  | Reporting Period) / (Number of Orders Confirmed in Reporting Period) X 100   |
|   | Definition: Measures the percentage of E911 database updates within a 24-hour period.  |
|   | Methodology: Mechanized metric from ordering system  |
|   | 2. E911 Accuracy = E (Total number of SOIR orders for E911 updates) - Total number of Service Order Interface Records (SOIRs) with errors generated from Daily TN activity (based on the E911 Local Exchange Carrier Guide for Facility-Based Providers)   / (Total number of SOIR orders for E911 updates) X 100  |
| **  | Definition: Measures the percentage of accurate 911 database updates   |
| y see see                                     | Methodology: Mechanized metric from ordering system  |

# TRUNK GROUP PERFORMANCE

| Function:                   | Interconnection Trunk Performance   |
|-----------------------------|---|
| Measurement<br>Overview:    | In order to ensure quality service to the CLECs as well as protect the integrity of the BST network, BST collects traffic performance data on the trunk groups interconnected with the CLECs as well as all other trunk groups in the BST network.  |
| Measurement<br>Methodology: | Comparative Trunk Group Service Summary. Provides comparative measurements of the trunk groups which exceed the blocking threshold during their busy hours, as well as the total number of trunk groups measured.   |
| •                           | 2. Trunk Group Service Report: Contains the service performance results of all final trunk groups (both BST administered trunk groups and CLEC administered trunk groups) between Point of Termination (POT) and BST tandems or end offices, by region, by CLEC, CLEC Aggregate, and BST aggregate.   |
|                             | Specifically measures the total number of trunk groups, number of trunk groups measured, and the number of trunk groups which exceed the blocking threshold during their busy hours.  |
| 4                           | 3. Trunk Group Service Detail: Provides a detailed list of all final trunk groups between POTs and BST end offices or tandems (A-end and Z-end for BST Local trunks) including the actual blocking performance when blocking exceeds the measured blocking threshold. The blocking performance includes the observed blocking number for a particular Trunk Group Serial Number (TGSN).  Blocking thresholds for all trunk groups are 3%, except BST CTTG, which is 2%. |
|                             | Measured Blocking =[(Total number of Blocked Calls)/(Total number of Attempted Calls)] X 100  |

| Reporting Dimensions:                       | Excluded Situations:                       |

Trunking Definitions (Continued)

| Field Name | Description  | Data Type  |
|------------|--|------------|
| TKS        | Total number of trunks in service in a trunk group   | Numeric    |
| VAL DAYS   | Total number of valid days of measurement  | Numeric    |
| NBR RPTS   | Number of consecutive monthly reports for which the trunk group exceeded the measured blocking threshold | Numeric(2) |
| RMKS       | Cause of blocking and/or release plan  | AlphaNum   |

| Collocation                 |  |
|-----------------------------|--|
| Function:                   | Response Interval, Provisioning Interval and Timeliness for Providing Collocation Space to a CLEC in a BellSouth Central Office.   |
| Measurement<br>Overview:    | Collocation is the placement of customer-owned equipment in BellSouth Central Offices for interconnecting to BellSouth's tariffed services and unbundled network elements. BellSouth "Fers both Virtual and Physical Collocation and will report its prformance on these otherings separately. The milestenes in the process for which measurements will be provided is: the average time to respond to a request after we |
|                             | have the complete application; the average time between receiving the bona fide firm order until the space is turned over to the CLEC; and the percentage of due dates on firm orders missed.  |
| Measurement<br>Methodology: | <ol> <li>Average Response Time = Σ (Request Response Date &amp; Time) - (Request<br/>Submission Date &amp; Time)/Count of Request submitted in Reporting Period.</li> </ol>  |
|                             | Definition: Measures the average time from the receipt of a complete and accurate Collocation Request (including receipt of Application Fees) to the date BellSouth responds in writing.   |
|                             | Methodology: Manual  |
|                             | <ol> <li>Average Arrangement Time = Σ (Date &amp; Time Collocation Arrangement is<br/>Complete) - (Date &amp; Time Order for Collocation Arrangement submitted)/Total<br/>Numbers of Collocation Arrangements Completed during Reporting Period."</li> </ol>   |
|                             | Definition: Measures the Average Time from the receipt of complete and accurate Firm Order (including Fees) to date BellSouth completes the Collocation Arrangement [Called "BellSouth complete date". Assumes space and construction complete and network infrastructure complete.]   |
|                             | Methodology: Manual  |
|                             | 3. % of Due Dates Missed = (Number of Orders not completed w/i ILEC committed Due Date during reporting period) / (Number of Orders scheduled for completion in reporting period) X 100.   |
|                             | Definition: Measures the percent of Collocation space request, including construction and network infrastructure, that are not complete on the due date.  Methodology:  Manual   |

| Reporting Dimensions:                          | Excluded Situations:                       |  |
|--|--|--|
| State, Regional and MSA <sup>31</sup> Level    | Any order canceled by the CLEC.            |  |
| <ul> <li>Virtual</li> </ul>                    | Time for BST to obtain any permits         |  |
| • Physical                                     | Collocation contract negotiations          |  |
| Data Retained Relating to CLEC Experience:     | Data Retained Relating to BST Performance: |  |
| Report Month                                   | Report Month                               |  |
| CLEC Order Number                              | Application                                |  |
| Application Submission Date                    | Application Response                       |  |
| <ul> <li>Firm Order Submission Time</li> </ul> | Firm Order                                 |  |
| Space Acceptance Date                          | BST Completion Data                        |  |
